The compounds represented by the general formula

20 (I) can be synthesized, for example, by methods A, B, C and D shown below in chemical formulae.

Method A:

1 wherein  $R^1$ ,  $R^2$ ,  $R^3$ ,  $R^4$ ,  $Q$ ,  $Y$ ,  $z^1$ ,  $z^2$ ,  $m$  and  $n$  are as  
defined above, Hal represents a halogen atom and  $M^1$   
represents a hydrogen atom or an alkali metal atom.

The pyrazole oxime derivatives represented by the  
5 general formula (I) can be obtained by reacting a compound  
of the general formula (II) with a compound of the general  
formula (III) in an inert solvent in the presence or  
absence of a base.

Solvents which can be used in the present invention  
10 may be any of those not disturbing the reaction, and  
include for example alcohols (e.g. isopropanol, tert-  
butanol, diethylene glycol), ketones (e.g. acetone, methyl  
ethyl ketone, cyclohexanone), ethers (e.g. diethyl ether,  
diisopropyl ether, tetrahydrofuran, dioxane, monoglyme,  
15 diglyme), halogenated hydrocarbons (e.g. dichloroethane,  
chloroform, carbon tetrachloride, tetrachloroethane),  
aromatic hydrocarbons (e.g. benzene, chlorobenzene,  
nitrobenzene, toluene), nitriles (e.g. acetonitrile),  
dimethyl sulfoxide, dimethylformamide and water. These  
20 solvents can be used alone or in combination. When a two-  
phase reaction is carried out using the solvents in  
combination, phase transfer catalysts such as triethyl-  
benzylammonium chloride, trioctylmethylammonium chloride,  
etc. may be used.

25 For the base, inorganic and organic bases can be  
used. The inorganic bases include for example alkali or  
alkaline earth metal carbonates such as sodium carbonate,  
potassium carbonate, calcium carbonate, sodium

1 hydrogencarbonate, etc., alkali or alkaline earth metal hydroxides such as sodium hydroxide, potassium hydroxide, calcium hydroxide, etc., and alkali metal hydrides such as lithium hydride, sodium hydride, etc.

5 The organic bases include for example diethylamine, triethylamine, pyridine, 4-dimethylaminopyridine, etc.

As to the amount of the base used, it suffices to use an amount equimolar to the compound represented by the  
10 general formula (II), but amounts in excess thereof will do.

The compound of the general formula (II) used in the present invention can be produced, for example, by the method described below:

1 wherein  $R^1$ ,  $R^2$ ,  $R^3$ ,  $Y$ ,  $Z^1$ ,  $m$ , Hal and  $M^1$  are as defined above.

That is, the compound of the general formula (II) can be produced by reacting a compound of the general formula (IV) with a compound of the general formula (V) in a suitable solvent and subsequently reacting the resulting compound of the general formula (VI) with hydroxylamine.

Among the compounds represented by the general formula (III), especially when  $Q$  is methylene,  $Z^2$  is a 10 single bond and  $R^4$  is a substituted phenyl group, are also some novel compounds, but they can be produced in the same manner as in the case of the known compounds.

Method B:

1 wherein  $R^1$ ,  $R^2$ ,  $R^3$ ,  $R^4$ ,  $Q$ ,  $Y$ ,  $Z^1$ ,  $Z^2$ ,  $m$  and  $n$  are as  
defined above.

5 The pyrazole oxime derivatives represented by the general formula (I) can be obtained by reacting a compound  
of the general formula (VI) with a compound of the general  
formula (VII) in an inert solvent.

For the solvent which can be used in this reaction, there are mentioned the solvents except ketones shown in Method A.

10 The compound represented by the general formula (VII) can be produced according to the well-known method, for example, described in Methoden der Organischen Chemie (Hougen Weyl) Band X/I Stickstoffverbindungen Teil I, p 1192.

15 Method C:

(VIII)

1 wherein  $R^1$ ,  $R^2$ ,  $R^3$ ,  $R^4$ ,  $Q$ ,  $Y$ ,  $Z^1$ ,  $Z^2$ ,  $m$  and  $n$  are as defined above, and  $M^2$  represents a hydrogen atom or an alkali metal atom.

5 The pyrazole oxime derivatives represented by the general formula (I) can be obtained by reacting a compound of the general formula (VIII) with a compound of the general formula (IX) in an inert solvent in the presence or absence of a base.

10 For the solvent and base which can be used in this reaction, there are mentioned the solvents and bases shown in Method A.

Method D:

15 thio.

That is, the pyrazole oxime derivatives represented by the general formula (Ia) can be obtained by reacting a compound of the general formula (X) with a compound of the general formula (XI) in an inert solvent in the presence of a dehydrating agent. The compound (X) may be reacted with the compound (XI) after converting it to acid chloride.

20

Solvents which can be used in this reaction may be any of those not disturbing the reaction, and

1 include for example ethers (e.g. diethyl ether, tetra-  
hydrofuran, dioxane, diethylene glycol), halogenated  
hydrocarbons (e.g. dichloromethane, chloroform, carbon  
tetrachloride), dimethyl sulfoxide, dimethylformamide,  
5 etc. These solvents may be used alone or in combination.

In the methods A to D, the reaction temperature  
may properly be selected from a range of from room  
temperature to the boiling point of the solvent. The  
reaction time depends upon the reaction temperature and  
10 reaction scale, but it may properly be selected from a  
range of from 1 minute to 48 hours.

As to the molar ratio of the reagents in  
practicing the reaction of the present invention, they  
are used in equimolar amounts because this reaction is an  
15 equimolar reaction, but either one of them may be used  
in excess of the other.

After completion of the reaction, the desired  
compound can be separated by the usual methods, and if  
necessary, can be purified by recrystallization, column  
20 chromatography, etc.

The pyrazole oxime derivatives represented by  
the general formula (I) have two isomers, E-isomer and  
Z-isomer. In the scope of the present invention are  
also included the both isomers and their mixtures.

1 Representative examples of the pyrazole oxime derivatives represented by the general formula (I) will be shown in Table 1, but the derivatives are not limited to these examples.

- 96 -

1 of methyl 4-bromomethylbenzoate and 1.19 g (0.009 mole) of potassium carbonate were added to 50 ml of acetone, and the resulting mixture was heated under reflux for 8 hours. After completion of the reaction, acetone was removed by 5 evaporation under reduced pressure, after which water was added to the residue and extraction was carried out with ethyl acetate. The ethyl acetate extract was washed with water and dried, and ethyl acetate was removed by evaporation to obtain an oily product. This oily product 10 was column-chromatographed on silica gel to obtain 2.0 g of the desired product.

Yield 61%.  $n_D^{20}$  1.5612

Example 2 Tert-butyl 4-[(1,3-dimethyl-5-phenoxyprazol-4-yl)methyleneaminoxyethyl]benzoate (compound 15 No. 60)

2.0 Grams (0.00855 mole) of 1,3-dimethyl-5-phenoxyprazole-4-carbaldehyde oxime was dissolved in 20 ml

1 of dimethyl sulfoxide, and after adding 0.65 g (0.0116  
mole) of powdery potassium hydroxide, the resulting mixture  
was stirred at 30°<sup>o</sup>C for 30 minutes. To this solution  
was added 2.32 g (0.00855 mole) of tert-butyl 4-  
5 bromomethylbenzoate, and reaction was carried out at from  
50° to 60°<sup>o</sup>C for 1 hour. After completion of the reaction,  
water was added to the reaction solution which was then  
extracted with ethyl acetate. The ethyl acetate extract  
was washed with water and dried, and ethyl acetate was  
10 removed by evaporation to obtain crude crystals. The  
crystals were recrystallized from methanol to obtain 2.4 g  
of the desired compound.

Yield 67.0%. m.p. 101.7°C.

Example 3 Methyl 2-[{5-(4-chlorophenoxy)-1,3-dimethyl-  
15 pyrazol-4-yl}methylenaminoxymethyl]benzoate  
(compound No. 3)

1        2.0 Grams (0.00755 mole) of 5-(4-chlorophenoxy)-  
1,3-dimethyl-pyrazole-4-carbaldehyde oxime was dissolved in  
20 ml of dimethylformamide, and after adding 0.5 g (0.0125  
mole) of powdery sodium hydroxide, the resulting mixture  
5        was thoroughly stirred. To this solution was added 1.73 g  
(0.00755 mole) of methyl 2-bromomethylbenzoate, and  
reaction was carried out at from 70° to 80°C for 5 hours.  
After completion of the reaction, water was added to the  
reaction solution which was then extracted with ethyl  
10      acetate. The ethyl acetate extract was washed with water  
and dried, and ethyl acetate was removed by evaporation to  
obtain an oily product. This oily product was column-  
chromatographed on silica gel to obtain 2.0 g of the  
desired compound.

15      Yield 64.0%.       $n_D^{20}$  1.5788.

4-yl)methyleneaminoxyethyl]benzoate  
(compound No. 174)

1        3.0 Grams (0.0121 mole) of 1,3-dimethyl-5-phenylthiopyrazole-4-carbaldehyde oxime, 2.57 g (0.0121 mole) of isopropyl 4-chloromethylbenzoate and 2.8 g (0.026 mole) of sodium carbonate were added to 50 ml of methyl 5 ethyl ketone, and the resulting mixture was heated under reflux for 5 hours. After completion of the reaction, methyl ethyl ketone was removed by evaporation under reduced pressure, after which water was added to the residue and extraction was carried out with ethyl acetate.

10      The ethyl acetate extract was washed with water and dried, and ethyl acetate was removed by evaporation to obtain an oily product. This oily product was column-chromatographed on silica gel to obtain 3.0 g of the desired compound.

5.0 Grams (0.00216 mole) of 1,3-dimethyl-5-phenoxy-pyrazole-4-carbaldehyde oxime and 41.0 g (0.218 mole) of 1,2-dibromomethane were dissolved in 100 ml of 10 dimethyl sulfoxide, and after adding 14.4 g (0.219 mole) of 85% powdery potassium hydroxide with ice-cooling, the resulting solution was stirred for 30 minutes. After completion of the reaction, the reaction solution was poured into 300 ml of water, extracted with three 80-ml 15 portions of ether and washed with 300 ml of water. The ether extract was dried over anhydrous sodium sulfate, and ether was removed by evaporation. The residue was dry column-chromatographed on silica gel to obtain 5.2 g of 1,3-dimethyl-5-phenoxy-pyrazol-4-carbaldehyde oxime 20 0-2-bromoethyl ether.

1        The present invention provides a technique for exterminating or controlling injurious insects and mites using the physiological activity of the compounds of the present invention. In one of the embodiments of the  
5 invention, the compounds are directly applied as such to the objects to be protected or to the pests to be controlled (undiluted spray). For instance, the compounds of the present invention in the form of a liquid of 95% or higher purity can be sprayed from aeroplanes to form a fog  
10 of extremely fine liquid particles.

15      The compounds of the present invention can also be used to treat ponds and pools in which the larvae of the insects live or treat environmental water or irrigative water grown with hosts for the larvae to render the living environment or feed (hosts) toxic to the larvae.

20      As is customary in the art, however, in order to exterminate or control injurious insects and mites using the physiological activity of the compounds of the present invention, the compounds are applied in most cases in a form suitable for use, for example, as supported on or diluted with inert carriers and if necessary, mixed with auxiliary agents.

25      General suggestions regarding the formulation of insecticidal compositions with the compounds of the present invention will be described below.

30      The compounds of the present invention are mixed with a suitable proportion of suitable inert carriers together with auxiliary agents if necessary to allow the

1 compounds to dissolve, disperse, suspend, mix, impregnate,  
adsorb or adhere, and thus they are formed into suitable  
preparations such as for example solutions, suspensions,  
emulsifiable concentrates, oil sprays, wettable powders,  
5 dusts, granules, tablets, pellets, pastes, aerosols, etc.

The inert carriers used in the formulation may be  
either solid or liquid. As examples of the solid carriers,  
there may be mentioned vegetable powders such as soybean  
flour, cereal flour, wood flour, bark flour, saw dust,  
10 powdered tobacco stalk, powdered walnut shell, bran,  
powdered cellulose, and extraction residues of vegetables;  
fibrous materials such as paper, corrugated paperboard, and  
waste cloth; synthetic polymers such as powdered synthetic  
resins; inorganic or mineral products such as clays (e.g.  
15 Kaolin, bentonite, and acid clay), talcs (e.g. talc and  
pyrophyllite), siliceous substances [e.g. diatomaceous  
earth, silica sand, mica, and "white carbon" (highly  
dispersed synthetic silicon dioxide, also called finely  
divided hydrated silica or hydrated silicon dioxide, some  
20 commercial products containing calcium silicate as major  
constituent)], activated carbon, powdered sulfur, pumice,  
calcined diatomaceous earth, ground brick, fly ash, sand,  
calcium carbonate, and calcium phosphate; chemical  
fertilizers such as ammonium sulfate, ammonium nitrate,  
25 urea, and ammonium chloride; and farmyard manure. These  
materials are used alone or in combination. Materials  
usable as liquid carriers are selected from those which  
will dissolve the active ingredients and those which do not

1 dissolve them, but can disperse them with the aid of  
adjuvants. For example, the following materials can be  
used alone or in combination: Water, alcohols (e.g.  
methanol, ethanol, isopropanol, butanol, ethylene glycol),  
5 ketones (e.g. acetone, methyl ethyl ketone, methyl isobutyl  
ketone, diisobutyl ketone and cyclohexanone), ethers (e.g.  
ethyl ether, dioxane, cellosolves, dipropyl ether and  
tetrahydrofuran), aliphatic hydrocarbons (e.g. gasoline and  
mineral oils), aromatic hydrocarbons (e.g. benzene,  
10 toluene, xylene, solvent naphtha and alkynaphthalenes),  
halohydrocarbons (e.g. dichloroethane, chlorinated benzenes,  
chloroform and carbon tetrachloride), esters (e.g. ethyl  
acetate, dibutyl phthalate, diisopropyl phthalate and  
dioctyl phthalate), acid amides (e.g. dimethylformamide,  
15 diethylformamide and dimethylacetamide), nitriles  
(e.g. acetonitrile), and dimethyl sulfoxide.

Gaseous carriers include freons and other aerosol  
propellants which are a gas under normal conditions.

The adjuvants, which are mentioned below, are  
20 used according to individual purposes. In some cases, they  
are used in combination with one another. In some other  
cases, no adjuvant is used at all.

For the purpose of emulsification, dispersion,  
solubilization and/or wetting of the active ingredients,  
25 there are used surface active agents such as for example  
polyoxyethylene alkylaryl ethers, polyoxyethylene alkyl  
ethers, polyoxyethylene higher fatty acid esters,  
polyoxyethylene resinates, polyoxyethylene sorbitan

1 monolaurate, polyoxyethylene sorbitan monooleate, alkylarylsulfonates, naphthalenesulfonic acid condensation products, ligninsulfonates and higher alcohol sulfate esters.

5 For the purpose of stabilizing the dispersion, tackification and/or agglomeration of the active ingredients, there may be used for example casein, gelatin, starch, alginic acid, methylcellulose, carboxymethylcellulose, gum arabic, polyvinyl alcohol, turpentine  
10 oil, rice bran oil, bentonite and ligninsulfonates.

For the purpose of improving the flow property of the solid compositions, it is recommendable to use waxes, stearates or alkyl phosphates.

As peptizers for dispersible compositions, it  
15 is also recommendable to use naphthalenesulfonic acid condensation products and polyphosphates.

It is also possible to add a defoamer such as for example a silicone oil.

The content of the active ingredient may be  
20 adjusted as occasion demands. For the preparation of powdered or granulated products, the content is usually from 0.5 to 20% by weight, and for the preparation of emulsifiable concentrates, suspension concentrates or wettable powders, it is preferably from 0.1 to 50% by  
25 weight.

For controlling various insects, mites and fungi, inhibiting their growth and protecting useful plants from damage caused by these insects, mites and

1 fungi, the compositions of the present invention for  
use in agriculture and horticulture are applied in  
insecticidally, acaricidally or fungicidally effective  
amounts. In applying the present compositions, they  
5 are applied, as such or after properly diluted with or  
suspended in water or other suitable medium, to soil or  
the foliage of crops to be protected from the attack of  
insects, mites and fungi.

The amount of the active ingredient used  
10 depends upon various factors such as for example the  
purpose of application, growth state of crops, weather,  
environmental conditions, the form of the composition,  
the mode of application, the type of fields to be  
treated, and the like.

15 In applying the present fungicidal compositions  
alone, the dosage of the present active ingredient is  
preferably selected from a range of from 0.1 to 500 g per  
10 ares.

Furthermore, the present compounds can be  
20 applied in the form of mixed formulations with other  
fungicides, insecticides, fertilizers and plant growth  
regulators, as far as such agents can be used in combi-  
nation with the present compounds.

is not limited to these examples only.

Test example 1 Fungicidal activity against the powdery  
mildew of barley (Erysiphe graminis f.  
20 sp. hordei)

Barley seedlings at 2-leaf stage were sprayed  
with test compound (200 ppm) one day after inoculation  
with conidia of Erysiphe graminis f. sp. hordei. The  
seedlings were kept in a constant-temperature room at  
25 25°C for one week and the percentage of the infected  
area per leaf was examined. The fungicidal activity  
was judged based on the following criterion in  
comparison with the untreated plot.

Oat seedling at 8-leaf stage were sprayed with  
test compound (200 ppm) one day after inoculation with  
5 uredospores of Puccinia coronata f.sp. avenae. The  
seedlings were kept in a constant-temperature room at 25°C

1 Test example 3 Fungicidal activity against the downy  
mildew of cucumber (Pseudoperonospora cubensis)

Cucumber plants at 2-leaf stage were sprayed with  
test compound (200 ppm) one day before inoculation with  
5 zoospores of Pseudoperonospora cubensis. After the plants  
were kept in a humid room at 25°C one day and then in a  
greenhouse for six days, the degree of infection per leaf  
was examined and the fungicidal activity was judged  
according to the same criterion as in Test example 1.

10 The results are shown in Table 4.

1 Test example 4 Insecticidal activity against the brown  
planthopper (Nilaparvata lugens)

Rice seedlings were dipped into the aqueous emulsion of the compound at 200 ppm for 30 seconds. After 5 air-drying, the seedling were placed in a glass tube, and the 3rd instar nymphs were inoculated on the plants. On 8th day after treatment, the corrected mortality was calculated and the insecticidal activity was judged based on the following criterion.

10 The results are shown in Table 5.

A:	Reviced Mortality	100 - 90%
B:	"	89 - 80%
C:	"	79 - 50%

1 Test example 5 Insecticidal activity against the  
diamondback moth (Plutella xylostella)

Eggs laid on a leaf piece (6 cm x 5 cm) of a  
chinese cabbage were dipped into the aqueous emulsion of  
5 the compound at 500 ppm for 30 seconds. After air-  
drying, the insects and the plant were placed in a petri  
dish. On 6th day after treatment, the corrected mortality  
was calculated and the insecticidal activity was judged  
according to the same criterion as in the test example 4.

10 The results are shown in Table 6.

1 Test example 6 Insecticidal activity against the green  
peach aphid (Myzus persicae)

All stages of the aphids were inoculated on a  
chinese cabbage. Insects and the plant were sprayed with  
5 the aqueous emulsion of the compound at 200 ppm. On 3rd  
day after treatment, the insecticidal activity was judged  
according to the same criterion as in the test example 4.

The results are shown in Table 7.

1 Test example 7 Acaricidal activity against the citrus red  
mite (Panonychus citri)

Female adults were inoculated on a grapefruit leaf, and were sprayed with the aqueous emulsion of the 5 compound at 200 ppm. On 10th day after treatment, the number of the progeny survived was counted and acaricidal activity was judged according to the same criterion as in the test example 4.

The results are shown in Table 8.

1 Test example 8 Acaricidal activity against the twospotted  
spidermite (Tetranychus urticae)

All stages of the mites were inoculated on a soybean plant. The mites and the plant were sprayed with 5 the aqueous emulsion of the compound at 200 ppm. On 8th day after treatment, the acaricidal activity was judged according to the same criterion as in the test example 4.

The results are shown in table 9.
